

ZOU-402 Per-Agent Observability Report

Period: 2026-06-23 to 2026-06-30 · Generated: 2026-06-30T15:00 UTC

Executive Summary

Over the past 7 days, the agent fleet executed **679 agent runs** across 54 agents, totaling **1,027 model calls** at a cost of **\$1.17**. The fleet is broadly healthy, but **2 agents exceed the 20% failure threshold** requiring attention:

● **zbr-audit-paired-branches — 50% failure rate (6 runs, 3 failed)**

This automation is failing half its runs. Likely related to stale git branch conditions or merged PR branch cleanup. Needs investigation and either fix or pause.

● **mem-reindex-qdrant — 100% failure rate (1 run, 1 failed)**

Single-run failure. The 50-minute duration (3,025s) suggests Qdrant reindex may have timed out or hit an OOM condition. May be a one-off, but worth monitoring.

⚠ **sys-audit-agent-paths — 14% failure rate (7 runs, 1 failed)**

Below 20% threshold but notable — 1 out of 7 runs failed with 876s avg latency. Monitor next cycle.

📁 Workload Breakdown

WORKLOAD	COUNT	COST	AVG LATENCY	P95
gate	469	\$1.04	1,422ms	2,654ms
briefing	375	\$0.07	1,760ms	3,739ms
extraction	177	\$0.06	11,000ms	48,387ms
summarization	2	\$0.00	35,667ms	39,746ms
consensus-gate	4	\$0.00	6,353ms	9,375ms

🚨 Agents Exceeding Failure Threshold

AGENT	RUNS	AVG LATENCY	FAIL RATE	STATUS
zbr-audit-paired-branches	6	54s	50%	3 of 6 runs failed — likely stale branch state
mem-reindex-qdrant	1	3,025s	100%	50-min timeout — possible Qdrant OOM/resource issue

🔍 Active Agents (Sorted by Runs)

AGENT	RUNS	AVG DURATION	FAIL RATE
[SYS] Sweep Build Watchdogs	356	0s	0%
sys-watch-automation-contracts	91	11s	0%
mem-index-vault	30	10s	0%
sys-audit-agent-paths	7	876s	14%
zbr-audit-paired-branches	6	54s	50%
mem-reindex-qdrant	1	3,025s	100%

† Only agents with failures shown — all other 48 agents at 0% fail rate.

🔍 Anomaly Detection ($>2\sigma$)

Threshold: **$>18,983\text{ms}$** ($\mu=3,282\text{ms}$, $\sigma=7,851\text{ms}$). Found **35 anomalies (3.4%)** — below 5% alert threshold. All anomalies are from the **extraction** workload using `deepseek/deepseek-chat-v3-0324`, suggesting a backend-specific latency issue rather than a systemic problem.

⚠️ Other Findings

⚠️ **sys-audit-agent-health** — 1 CRIT finding on latest run

The latest health audit produced a critical finding (117s run, 0% fail rate by our metric, but flagged CRIT). Check the agent-health logs for details.

🔧 Recommendations

1. **Investigate zbr-audit-paired-branches:** 50% failure rate suggests stale branch refs or merged PR branches causing git errors. Consider pausing if not mission-critical.
2. **Review mem-reindex-qdrant:** 50-minute run timing out. Consider adjusting Qdrant batch size or memory limits.
3. **Monitor sys-audit-agent-paths:** 14% fail rate trending up. If it hits 20% next cycle, investigate.
4. **Extraction anomalies:** DeepSeek extraction workload has high p95 latency (48s). Consider timeouts or model fallback for extraction tasks.
5. **sys-audit-agent-health CRIT:** Review the latest health audit output for the specific critical finding.
